

# Jobs Board - Phase 1

## Phase 1

Using the following colours, you should design and develop an application using **Angular and Bootstrap CSS** with the following features:

- Design and Develop a **Login** screen with email and password
- Design and Develop a **Registration** Screen with name, email and password
- Design and develop a home screen that displays a list of available jobs with their **title, date of creation, salary, remote work availability (yes/no), company name, company country and job type (full-time or part-time)**. This screen should only be visible to logged-in users. For this task, you should use static information or mock data.

### API

Method	URL	Payload	D
GET	https://jobs-api.jmscarpa.com.br/	-	A
POST	https://jobs-api.jmscarpa.com.br/sessions	<pre>{   email: "",   password: "" }</pre>	C
POST	https://jobs-api.jmscarpa.com.br/registrations	<pre>{   name: "",   email: "",   password: "" }</pre>	R

Both POST requests (sessions and registrations) can return a 201 status code (created) in case of success with user id, name and email, or a 422 status code (unprocessable entity) in case of failure. If the latter occurs, an error message will be returned.
